(54) Title: METHOD OF PROVIDING NOVEL DNA SEQUENCES

(57) Abstract

The present invention relates to a method of providing novel DNA sequences encoding a polypeptide with an activity of interest, comprising the following steps: i) PCR amplification of said DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest, ii) linking the obtained PCR product to a 5' structural gene sequence and a 3' structural gene sequence, iii) expressing said resulting hybrid DNA sequence, iv) screening for hybrid DNA sequences encoding a polypeptide with said activity of interest or related activity, v) isolating the hybrid DNA sequence identified in step iv). Further, the invention also relates novel DNA sequences provided according to the method of the invention and polypeptides with an activity of interest encoded by said novel DNA sequences of the invention.

Title: Method of providing novel DNA sequences

FIELD OF THE INVENTION

The present invention relates to a method of providing novel DNA sequences encoding a polypeptide with an activity of interest, novel DNA sequences provided according to the method of the invention, polypeptides with an activity of interest encoded by novel DNA sequences of the invention.

BACKGROUND OF THE INVENTION

10 The advent of recombinant DNA techniques has made it possible to select single protein components with interesting properties and produce them on a large scale. This represents an improvement over the previously employed production process using microorganisms isolated from nature and producing a mixture of proteins
15 which would either be used as such or separated after the production step.

Since the traditional methods were rather time-consuming, more rapid and less cumbersome methods were developed.

A such technique is described in WO 93/11249 (Novo Nordisk
20 A/S).

The method described in WO 93/11249 comprises the steps of:

- a) cloning, in suitable vectors, a DNA library from an organism suspected of producing one or more proteins of interest;
- b) transforming suitable yeast host cells with said vectors;
- 25 c) culturing the host cells under suitable conditions to express any protein of interest encoding by a clone in the DNA library; and
- d) screening for positive clones by determining any activity of a protein expressed in step c).

30 According to this method it is necessary to prepare a DNA library, comprising complete genes encoding polypeptides with activities of interest. Such a library has traditionally been made on mRNA isolated from micro-organisms which has been cultivated and isolated.

35 As it is only possible with known methods to cultivate about 2% of the microorganisms known today (i.e. cultivable microorganisms), genes encoding polypeptides from a huge number of

microorganisms (i.e. un-cultivable microorganisms) are generally difficult to identify and clone on the basis of screening technologies used today, such as the above mentioned.

5 SUMMARY OF THE INVENTION

It is the object of the present invention to provide a method for providing a novel DNA sequence encoding a polypeptide with an activity of interest from micro-organisms without having to cultivate and isolate said micro-organisms.

10 In the first aspect the invention relates to a method of providing novel DNA sequences encoding a polypeptide with an activity of interest, comprising the following steps:

i) PCR amplification of said DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of
15 interest,

ii) linking the obtained PCR product to a 5' structural gene sequence and a 3' structural gene sequence,

iii) expressing said resulting hybrid DNA sequence,

iv) screening for hybrid DNA sequences encoding a polypeptide
20 with said activity of interest or related activity,

v) isolating the hybrid DNA sequence identified in step iv)

Further, the invention also relates novel DNA sequences provided according to the method of the invention and polypeptides with an activity of interest encoded by said novel
25 DNA sequences of the invention.

BRIEF DESCRIPTION OF THE DRAWING

Figure 1 shows the cloning strategy of novel hybrid enzyme sequences.

30 a is an exact N-terminal consensus primer

a_{rc} is the reverse and complement primer to a

b is a degenerated homologous N-terminal primer

c is a degenerated homologous C-terminal primer

d is an exact C-terminal consensus primer

35 d_{rc} is a reverse and complement of d

f is an exact reverse and complement C-terminal primer extended with a sequence which includes a SalI restriction recognition site.

e is an exact N-terminal primer extended with a sequence which includes an EcoRI restriction recognition site.

1. (in figure 1)

PCR with primers ab and cd to amplify unknown core genes with an activity of interest.

PCR with primers e and a_{rc} to obtain the N-terminal part of the known gene.

PCR with primers d_{rc} and f to obtain the C-terminal part of the known gene.

2. (in figure 1)

SOE-PCR with primers e and f to link the unknown core gene sequence with the known N- and C-terminal gene sequences and introduction of EcoRI and SalI restriction recognition sites.

3. Restriction enzyme digestion followed by ligation of the novel sequence into an expression vector and transformation into a host cell. Screening of clones expressing the produced gene product with the activity of interest.

Figure 2 shows a part of an alignment of prokaryote xylanases belonging to glycosyl hydrolases family 11.

Figure 3 shows an alignment of the translated DNA sequences of Pulpzyme® (SEQ ID NO 2) and the novel gene sequence found in soil, respectively.

Figure 4 shows a schematically a novel hybrid gene provided according to the invention. Part A and Part C are the known sequences linked to the unknown Part B.

Using Pulpzyme® (SEQ ID NO 1) as the starting sequence:

"1" indicated the first nucleotide of the novel hybrid gene provided according to the invention, "433" and "631" the start and end of the part constituted by the unknown gene sequence and "741" the last nucleotide of the novel hybrid gene sequence.

DEFINITIONS

Prior to discussing this invention in further detail, the following terms will first be defined.

"Homology of DNA sequences or polynucleotides" In the present context the degree of DNA sequence homology is determined as the degree of identity between two sequences indicating a derivation of the first sequence from the second. The homology may suitably be determined by means of computer programs known in the art, such as GAP provided in the GCG program package (Program Manual for the Wisconsin Package, Version 8, August 1994, Genetics Computer Group, 575 Science Drive, Madison, Wisconsin, USA 53711) (Needleman, S.B. and Wunsch, C.D., (1970), Journal of Molecular Biology, 48, 443-453).

"Homologous": The term "homologous" means that one single-stranded nucleic acid sequence may hybridize to a complementary single-stranded nucleic acid sequence. The degree of hybridization may depend on a number of factors including the amount of identity between the sequences and the hybridization conditions such as temperature and salt concentration as discussed later (vide infra).

Using the computer program GAP (vide supra) with the following settings for DNA sequence comparison: GAP creation penalty of 5.0 and GAP extension penalty of 0.3, it is in the present context believed that two DNA sequences will be able to hybridize (using low stringency hybridization conditions as defined below) if they mutually exhibit a degree of identity preferably of at least 70%, more preferably at least 80%, and even more preferably at least 85%.

"heterologous": If two or more DNA sequences mutually exhibit a degree of identity which is less than above specified, they are in the present context said to be "heterologous".

"Hybridization:" Suitable experimental conditions for determining if two or more DNA sequences of interest do hybridize or not is herein defined as hybridization at low stringency as described in detail below.

A suitable experimental low stringency hybridization protocol between two DNA sequences of interest involves pre-soaking of a filter containing the DNA fragments to hybridize

in 5 x SSC (Sodium chloride/Sodium citrate, Sambrook et al. 1989) for 10 min, and prehybridization of the filter in a solution of 5 x SSC, 5 x Denhardt's solution (Sambrook et al. 1989), 0.5 % SDS and 100 µg/ml of denatured sonicated salmon sperm DNA (Sambrook et al. 1989), followed by hybridization in the same solution containing a concentration of 10ng/ml of a random-primed (Feinberg, A. P. and Vogelstein, B. (1983) *Anal. Biochem.* 132:6-13), ³²P-dCTP-labeled (specific activity > 1 x 10⁹ cpm/µg) probe (DNA sequence) for 12 hours at ca. 45°C. The filter is then washed twice for 30 minutes in 2 x SSC, 0.5 % SDS at least 50°C, more preferably at least 55°C, and even more preferably at least 60°C (high stringency).

Molecules to which the oligonucleotide probe hybridizes under these conditions are detected using a x-ray film.

15 "Alignment": The term "alignment" used herein in connection with a alignment of a number of DNA and/or amino acid sequences means that the sequences of interest is aligned in order to identify mutual/common sequences of homology/identity between the sequences of interest. This procedure is used to identify common 20 "conserved regions" (vide infra), between sequences of interest. An alignment may suitably be determined by means of computer programs known in the art, such as ClusterW or PILEUP provided in the GCG program package (Program Manual for the Wisconsin Package, Version 8, August 1994, Genetics Computer 25 Group, 575 Science Drive, Madison, Wisconsin, USA 53711)(Needleman, S.B. and Wunsch, C.D., (1970), *Journal of Molecular Biology*, 48, 443-453).

"Conserved regions:" The term "conserved region" used herein in connection with a "conserved region" between DNA and/or 30 amino acid sequences of interest means a mutual common sequence region of the sequences of interest, wherein there is a relatively high degree of sequence identity between the sequences of interest. In the present context a conserved region is preferably at least 10 base pairs (bp)/ 3 amino 35 acids(a.a), more preferably at least 20 bp/ 7 a.a., and even more preferably at least 30 bp/ 10 a.a..

Using the computer program GAP (Program Manual for the Wisconsin Package, Version 8, August 1994, Genetics Computer

Group, 575 Science Drive, Madison, Wisconsin, USA 53711) (Needleman, S.B. and Wunsch, C.D., (1970), Journal of Molecular Biology, 48, 443-453) (vide supra) with the following settings for DNA sequence comparison: GAP creation penalty of 5 5.0 and GAP extension penalty of 0.3, the degree of DNA sequence identity within the conserved region is preferably of at least 80%, more preferably at least 85%, more preferably at least 90%, and even more preferably at least 95%.

"Sequence overlap extension PCR reaction (SOE-PCR)": The term 10 "SOE-PCR" is a standard PCR reaction protocol known in the art, and is in the present context defined and performed according to standard protocols defined in the art ("PCR A practical approach" IRL Press, (1991)).

"primer": The term "primer" used herein especially in 15 connection with a PCR reaction is an oligonucleotide (especially a "PCR-primer") defined and constructed according to general standard specification known in the art ("PCR A practical approach" IRL Press, (1991)).

"A primer directed to a sequence:" The term "a primer 20 directed to a sequence" means that the primer (preferably to be used in a PCR reaction) is constructed so it exhibits at least 80% degree of sequence identity to the sequence part of interest, more preferably at least 90% degree of sequence identity to the sequence part of interest, which said primer consequently is 25 "directed to". The primer is designed in order to specifically anneal at the region at a given temperature it is directed towards. Especially identity at the 3' end of the primer is essential for the function of the polymerase, i.e. the ability of a polymerase to extend the annealed primer.

30 "Polypeptide" Polymers of amino acids sometimes referred to as protein. The sequence of amino acids determines the folded conformation that the polypeptide assumes, and this in turn determines biological properties such as activity. Some polypeptides consist of a single polypeptide chain (monomeric), 35 whilst other comprise several associated polypeptides (multimeric). All enzymes and antibodies are polypeptides.

"Enzyme" A protein capable of catalysing chemical reactions. Specific types of enzymes are a) hydrolases

including amylases, cellulases and other carbohydrases, proteases, and lipases, b) oxidoreductases, c) Ligases, d) Lyases, e) Isomerases, f) Transferases, etc. Of specific interest in relation to the present invention are enzymes used
5 in detergents, such as proteases, lipases, cellulases, amylases, etc.

"known sequence" is the term used for the DNA sequences of which the full length sequence has been sequenced or at least the sequence of one conserved regions is known.

10 "unknown sequence" is the term used for the DNA sequences amplified directly from uncultivated micro-organisms comprised in e.g. a soil sample used as the starting materia. "Full length DNA sequence" means a structural gene sequence encoding a complete polypeptide with an activity of interest.

15 "un-cultivated" means that the micro-organism comprising the unknown DNA sequence need not be isolated (i.e. to provide a population comprising only identical micro-organisms) before amplification (e.g. by PCR).

The term "an activity of interest" means any activity for
20 which screening methods is known.

The term "un-cultivable micro-organisms" defined micro-organisms which can not be cultivated according to methods know in the art.

The term "DNA" should be interpreted as also covering other
25 polynucleotide sequences including RNA.

The term "linking" sequences means effecting a covalent binding of DNA sequences.

The term "hybrid sequences" means sequences of different origin merged together into one sequence.

30 The term "structural gene sequence" means a DNA sequence coding for a polypeptide with an activity.

The term "natural occurring DNA" means DNA, which has not been subjected to biological or biochemical mutagenesis. By biological mutagenesis is meant "in vivo" mutagenesis, i.e.
35 propagation under controlled conditions in a living organism, such as a "mutator" strain, in order to create genetic diversity. By biochemical mutagenesis is meant "in vitro" mutagenesis, such as error-prone PCR, oligonucleotide directed

site-specific or random mutagenesis etc.

DETAILED DESCRIPTION OF THE INVENTION

It is the object of the present invention to provide a method
5 for providing novel DNA sequences encoding polypeptides with an
activity of interest from micro-organisms without having to
cultivate said micro-organisms.

The inventors of the present invention have found that PCR-
screening using primers designed on the basis of known
10 homologous region, such as conserved regions, can be used for
providing novel DNA sequences. Despite the fact that known
homologous regions, such as conserved regions, are used for
primer designing a vast number of unknown DNA sequences have been
provided. This will be described in the following and illustrated
15 in the Examples.

The DNA sequences provided are full length hybrid structural
gene sequences encoding complete polypeptides with an activity of
interest made up of one unknown sequence and one or two known
sequences.

20 According to the invention it is essential to identify at
least two homologous regions, such as conserved regions, in known
gene sequences with the activity of interest. One or two selected
known structural gene sequence(s) is(are) used as templates (i.e.
as starting sequence(s)) for finding and constructing novel DNA
25 structural gene sequences with an activity of interest.

Said homologous regions, such as conserved regions, can be
identified by alignment of polypeptides with the activity of
interest and may e.g. be made by the computer program ClustalW
or other similar programs available on the market.

30

One known structural gene as the starting sequence

In the case of using one known structural gene sequence as the
starting sequence it will typically be comprised in a plasmid or
vector or the like. A part of the sequence between the two
35 identified homologous regions, such as conserved regions, are
deleted to avoid contamination by the wild-type structural gene.

The known DNA sequence, with the homologous regions, such as
conserved regions, placed at the ends, are linked to an unknown

DNA sequence amplified directly or indirectly from a sample comprising micro-organisms.

The identified homologous regions, such as conserved regions, must have a suitable distance from each other, such as 10 or more
5 base pairs in between. It is preferred to use homologous regions, such as conserved regions, placed in each end of the known structural full length gene.

However, if knowledge about a specific function (e.g. active site) of a domain (i.e. part of the structural gene sequence) is
10 available it may be advantageous to use conserved regions placed in proximity of and on each side said domain as basis for the PCR amplification to provide novel DNA sequences according to the invention which will be described below in details.

15 Two known genes as starting sequences

In the case of using two known structural genes as the starting sequences at least one homologous region, such as conserved region, should be identified in each of the two sequences within the polypeptide coding region.

20 In both case (i.e. one or two known genes as starting sequences) the homologous regions, such as conserve regions, should preferably be situated at each end of the structural gene(s) (i.e. the sequences encoding the N-terminal end (i.e. named Part A on figure 4) and the C-terminal end, respectively
25 (i.e. named Part C on figure 4) of the known part of the hybrid polypeptide

In the first aspect the invention relates to a method for providing novel DNA sequences encoding polypeptides with an activity of interest comprises the following steps:

- 30 i) PCR amplification of said DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest,
- ii) linking the obtained PCR product to a 5' structural gene sequence and a 3' structural gene sequence,
- 35 iii) expressing said resulting hybrid DNA sequence,
- iv) screening for hybrid DNA sequences encoding a polypeptide with said activity of interest or related activity,

v) isolating the hybrid DNA sequence identified in step iv)

In step i) the part between the corresponding homologous regions, such as conserved regions, of the unknown structural gene are amplified.

5 In an embodiment the PCR amplification in step i) is performed using naturally occurring DNA or RNA as template.

In another embodiment the micro-organism has not been subjected to "in vitro" selection.

The PCR amplification may be performed on a sample containing
10 DNA or RNA from un-isolated micro-organisms. According to the invention no prior knowledge about the unknown sequence is required.

In an embodiment of the invention said 5' and 3' structural gene sequences originate from two different known structural gene
15 sequences encoding polypeptides having the same activity or related activity.

The 5' structural gene sequence and the 3' structural gene sequence may also originate from the same known structural gene encoding a polypeptide with the activity of interest or from two
20 different known structural gene sequences encoding polypeptides having different activities. In the latter case it is preferred that at least one of the starting sequences originates from a known structural gene sequence encoding a polypeptide with the activity of interest.

25 In a preferred embodiment of the method of the invention the known structural gene is situated in a plasmid or a vector. In said case the method comprises the following steps:

- i) PCR amplification of DNA from micro-organisms with PCR primers being homologous to conserved regions of
30 a known gene encoding a polypeptide with an activity of interest,
- ii) cloning the obtained PCR product into a gene encoding a polypeptide having said activity of interest, where said gene is not identical to the gene from which the
35 PCR product is obtained, which gene is situated in an expression vector,
- iii) transforming said expression vector into a suitable host cell,

- iiia) culturing said host cell under suitable conditions,
- iv) screening for clones comprising a DNA sequence originated from the PCR amplification in step i) encoding a polypeptide with said activity of interest or a related activity,
- 5 v) isolating the DNA sequence identified in step iv).

According to this embodiment one known structural gene sequence is used as the starting sequence. It is to be understood that the PCR product obtained in step i) is cloned into a known
10 gene where a part of the DNA sequence, between the conserved regions, is deleted (i.e. cut out) or in an other way substituted with the PCR product. The deleted part of the known gene comprised in the vector may have any suitable size, typically between 10 and 5000 bp, such as from between 10 to 3000 bp.

15 A general problem is that, when amplifying DNA sequences encoding polypeptides with an activity by PCR, the obtained PCR product (i.e. being a part of an unknown gene) does not normally encode a polypeptide with the desired activity of interest.

Therefore, according to the invention the complete full length
20 structural gene, encoding a functional polypeptide, is provided by cloning (i.e. by substituting) the PCR product of the unknown structural gene into the known gene situated on the expression vector.

It should be emphasised that the DNA mentioned in step i), to
25 be PCR amplified, need not to comprise a complete gene encoding a functional polypeptide. This is advantageous as only a smaller region of the DNA of the micro-organism(s) in question need to be amplified.

The novel DNA sequences obtained according to the invention
30 consist of the PCR product merged or linked into the known gene, having a number of nucleotides between the conserved regions deleted. The PCR product is inserted into the known gene between the two ends of the cut open vector by overlapping homologous regions of about 10 to 200 bp at each end of the vector.

35 The resulting novel hybrid DNA sequences constitute complete full length genes comprising the PCR product and encodes a polypeptide with the activity of interest.

It is to be understood that it is not absolutely necessary to delete a part of the known gene sequence. However, if a part of the known gene sequence is not deleted re-ligation results in that the wild-type activity of the known gene is regained and thus give a high number of wild-type background clones, which would make the screening procedure more time consuming and cumbersome.

The PCR amplification in step i) can be performed on both cultivable and uncultivable micro-organisms by directly or indirectly amplification of DNA from the genomic material of the micro-organisms in the environment (i.e. directly or indirectly from the sample taken).

The micro-organisms

The micro-organisms from which the unknown DNA sequences are derived may be micro-organisms which cannot today be cultivated. This is possible as the DNA sequences can be amplified by PCR without the need first to cultivate and isolate the micro-organisms comprising the unknown DNA sequence(s).

It is however to be understood that the method of the invention can also be used for providing novel DNA sequences derived from micro-organisms which can be cultivated.

Therefore the method of the invention can be performed on both cultivable and un-cultivable organisms as the micro-organisms in question do not, according to the method of the invention, need to be cultivated and isolated from, e.g. the soil sample, comprising micro-organisms.

Starting material

The starting material, i.e. the sample comprising micro-organisms with the target unknown DNA sequences, may for instance be an environmental samples of plant or soil material, animal or insect dung, insect gut, animal stomach, a marine sample of sea or lake water, sewage, waste water, etc., comprising one or, as in most case, a vast number of different cultivable and/or uncultivable micro-organisms.

If the genomic material of the micro-organisms are readily accessible the PCR amplification may be performed directly on the

sample. In other cases a pre-purification and isolation procedure of the genomic material is needed.

Smalla et al. (1993), J. Appl. Bacteriol 74, p. 78-85; Smalla et al. (1993), FEMS Microbiol Ecol 13, p. 47-58, describes how to
5 extract DNA directly from micro-organisms in the environment (i.e. the sample).

Borneman et al. (1996), Applied and Environmental Microbiology, 1935-1943, describes a method for extracting DNA from soils.

10 A commercially available kit for isolating DNA from environmental samples, such as e.g. soils, can be purchased from BIO 101 under the tradename FastDNA® SPIN Kit.

Seamless™ Cloning kit (catalogue no. Stratagene 214400) is a commercial kit suitable for cloning of any DNA fragment into any
15 desired location e.g. a vector, without the limitation of naturally occurring restriction sites.

PCR amplification of DNA and/or RNA of micro-organisms in the environment is described by Erlich, (1989), PCR Technology. Principles and Applications for DNA Amplification, New
20 York/London, Stockton Press; Pillai, et al., (1991), Appl. Environ. Microbiol, 58, p. 2712-2722)

Other methods for PCR amplifying microbial DNA directly from a sample is described in Molecular Microbial Ecology Manual, (1995), Edited by Akkermans et al.. A suitable method for
25 microbial DNA from soil samples is described by Jan Dirk van Elsas et al., (1995), Molecular Microbial Ecology Manual 2.7.2, p. 1-10.

Stein et al., (1996), J. Bacteriol., Vol. 178, No. 2, p. 591-599, describes a method for isolating DNA from un-cultivated
30 prokaryotic micro-organisms and cloning DNA fragments therefrom.

The PCR primers being homologous to conserved regions of the known gene encoding a polypeptide with an activity of interest are synthesized according to standard methods known in the art
35 (see for instance EP 684 313 from Hoffmann-La Roche AG) on the basis of knowledge to conserved regions in the polypeptide with the activity of interest.

Said PCR primers may be identical to at least a part of the conserved regions of the known gene. However, said primers may advantageously be synthesized to differ in one or more positions.

Further, a number of different PCR primers homologous to the
5 conserved regions may be used at the same time in step i) of the method of the invention.

The cultivable or uncultivable micro-organisms may be both prokaryotic organisms such as bacteria, or eukaryotic organisms including algae, fungi and protozoa.

10 Examples of un-cultivable organisms include, without being limited thereto, extremophiles and planktonic marine organisms etc.

The group of cultivable organisms include bacteria, fungal organisms, such as filamentous fungi or yeasts.

15 In the case of using DNA from cultivable organisms the PCR amplification in step i) may be performed on one or more polynucleotides comprised in a vector, plasmid or the like, such as on a cDNA library.

Specific examples of "an activity of interest" include enzymatic
20 tic activity and anti-microbial activity.

In a preferred embodiment of the invention the activity of interest is an enzymatic activity, such as an activity selected from the group comprising of phosphatases oxidoreductases (E.C. 1), transferases (E.C. 2); hydrolases (E.C. 3), such as esterases
25 (E.C. 3.1), in particular lipases and phytase; such as glucosidases (E.C. 3.2), in particular xylanase, cellulases, hemicellulases, and amylase, such as peptidases (E.C. 3.4), in particular proteases; lyases (E.C. 4); isomerases (E.C. 5); ligases (E.C. 6).

30 The host cell used in step iii) may be any suitable cell which can express the gene encoding the polypeptide with the activity of interest. The host cells may for instance be a yeast, such as a strain of *Saccharomyces*, in particular *Saccharomyces cerevisiae*, or a bacteria, such as a strain of *Bacillus*, in
35 particular of *Bacillus subtilis*, or a strain *Escherichia coli*.

Clones found to comprise a DNA sequence originated from the PCR amplification in step i) may be screened for any activity of interest. Examples of such activities include enzymatic activity,

anti-microbial activity or biological activities.

The polypeptide with the activity of interest may then be tested for a desired performance under specific conditions and/or in combination with e.g. chemical compounds or agent. In the case
5 where the polypeptide is an enzyme e.g. the wash performance, textile dyeing, hair dyeing or bleaching properties, effect in feed or food may be assayed to identify polypeptides with a desired property.

10 Identification of conserved regions of prokaryote xylanases

Figure 2 shows an alignment of prokaryote xylanases from the family 11 of glycosyl hydrolases (B. Henrissat, Biochem J, 280:309-316 (1991)). There are several region where the amino acids are identical or almost identical, i.e. conserved
15 regions.

Examples of homologous regions or conserved regions in prokaryotic xylanases from family 11 of glycosyl hydrolases (B. Henrissat, (1991), Biochem J 280:309-316) are the sequence "DGGTYDIY" (SEQ ID NO 3) position 145-152, "EGYQSSG" (SEQ ID
20 NO. 4) position 200-206 in the upper polypeptide shown in figure 2.

Based on e.g. said regions degenerated PCR primers can be designed. These degenerated PCR primers can amplify unknown DNA sequences coding for polypeptides (i.e. referred to as PCR
25 products below) which are homologous to the known polypeptide(s) in question (i.e. SEQ ID NO 2) flanked by the conserved regions.

The PCR products obtained can be cloned into a plasmid and sequenced to check if they contain conserved regions and are
30 homologous to the known structural gene sequence(s).

A homologous PCR product is however not a guarantee that the sequence code for a part of a polypeptide having the desired activity of interest.

Therefore, according to the method of the invention one or
35 more steps selecting DNA sequences encoding polypeptides having the activity of interest follow the construction of the novel hybrid DNA sequences.

The unknown DNA sequences

When method of the invention is performed on DNA from samples of uncultivated organisms it is advantageous to screen 5 for gene products with the activity of interest.

A suitable method for doing this is to link the PCR products with a 5' sequence upstream the first conserved region DNA sequence and the 3' sequence downstream the second consensus, respectively, from the known gene sequence.

10 The product of the unknown gene sequence linked to an N-terminal and C-terminal part of a known gene product is then screened for the activity of interest.

The N-terminal and C-terminal parts can originate from the same gene product but it is not a prerequisite for activity. 15 The N-terminal and C-terminal parts may also originate from different gene products as long as they originate from the same polypeptide family e.g. the same glycosyl hydrolases.

A method to link the unknown gene sequence with the known sequences is to clone the PCR product into a known gene, 20 encoding a polypeptide having the activity of interest, which have had the sequences between the conserved regions removed.

Another method is merging the PCR product, the N-terminal part and the C-terminal part by SOE-PCR (splicing by overlap extension PCR) e.g. as shown in figure 1 and described in 25 detail in Example 1. Other methods known in the art may also be used.

In a second aspect the invention relates to a novel DNA sequence provided by the method of the invention and the polypeptide encoded by said novel DNA sequence.

30

MATERIALS AND METHODS

Pulpzyme® is a xylanase derived from *Bacillus* sp. AC13, NCIMB No. 40482. and is described in WO 94/01532 from Novo Nordisk A/S AZCL Birch xylan (MegaZyme, Australia).

35

Plasmids:

The *Aspergillus* expression vector pHD414 is a derivative of the plasmid p775 (described in EP 238 023). The construction of

PHD414 is further described in WO 93/11249.

The 43 kD EG V endoglucanase cDNA from *H. insolens* (disclosed in WO 91/17243) is cloned into pHD414 in such a way that the endoglucanase gene is transcribed from the TAKA-pro-
5 moter. The resulting plasmid is named pCaHj418.

Plates

LB-ampicillin plates: 10 g Bacto-tryptone, 5 g Bacto yeast extract, 10 g NaCl, in 1 litre water, 2% agar 0.1% AZCL Birch
35 xylan, 50 microg/ml ampicillin.

Equipment

Applied Biosystems 373A automated sequencer

PCR Amplification

All Polymerase Chain Reactions is carried out under standard conditions as recommended by Perkin-Elmer using AmpliTaq Gold polymerase.

Isolation of Environmental DNA

DNA is isolated from an environmental sample using FastDNA®
10 SPIN Kit for Soil according to the manufacture's instructions.

Methods used in Example 3

Strains and growth conditions

The fungal strains listed above, were streaked on PDA
15 plates containing 0.5 % Avicel, and examined under a microscope to avoid obvious mistakes and contaminations. The strains were cultivated in shake flasks (125 rpm and 26 °C) containing 30ml PD medium (to initiate the growth) and 150ml of BA growth medium for cellulase induction.

20 The production of cellulases in culture supernatants (typically after 3, 5, 7 and 9 days of growth) was assayed using 0.1 % AZCl-HE-cellulose in a plate assay at pH 3, pH 7 and pH 10. The mycelia were harvested and stored at - 80°C.

25 Preparation of RNase-free glassware, tips and solutions

All glassware used in RNA isolations were baked at + 250°C for at least 12 hours. Eppendorf tubes, pipet tips and plastic columns were treated in 0.1 % diethylpyrocarbonate (DEPC) in EtOH for 12 hours, and autoclaved. All buffers and water
30 (except Tris-containing buffers) were treated with 0.1 % DEPC for 12 hours at 37°C, and autoclaved.

Extraction of total RNA

The total RNA was prepared by extraction with guanidinium
35 thiocyanate followed by ultracentrifugation through a 5.7 M CsCl cushion [Chirgwin, (1979) Biochemistry 18, 5294-5299] using the following modifications. The frozen mycelia was ground in liquid N2 to fine powder with a mortar and a pestle,

followed by grinding in a precooled coffee mill, and immediately suspended in 5 vols of RNA extraction buffer (4 M GuSCN, 0.5 % Na-laurylsarcosine, 25 mM Na-citrate, pH 7.0, 0.1 M β -mercaptoethanol). The mixture was stirred for 30 min. at RT° and centrifuged (20 min., 10 000 rpm, Beckman) to pellet the cell debris. The supernatant was collected, carefully layered onto a 5.7 M CsCl cushion (5.7 M CsCl, 0.1 M EDTA, pH 7.5, 0.1 % DEPC; autoclaved prior to use) using 26.5 ml supernatant per 12.0 ml CsCl cushion, and centrifuged to obtain the total RNA (Beckman, SW 28 rotor, 25 000 rpm, RT°, 24h). After centrifugation the supernatant was carefully removed and the bottom of the tube containing the RNA pellet was cut off and rinsed with 70 % EtOH. The total RNA pellet was transferred into an Eppendorf tube, suspended in 500 μ l TE, pH 7.6 (if difficult, heat occasionally for 5 min at 65 °C), phenol extracted and precipitated with ethanol for 12 h at -20°C (2.5 vols EtOH, 0.1 vol 3M NaAc, pH 5.2). The RNA was collected by centrifugation, washed in 70 % EtOH, and resuspended in a minimum volume of DEPC-DIW. The RNA concentration was determined by measuring OD 260/280.

20

Isolation of poly(A)+RNA

The poly(A)+ RNAs were isolated by oligo(dT)-cellulose affinity chromatography [Aviv, (1972), Proc. Natl. Acad. Sci. U.S.A. 69, 1408-1412]. Typically, 0.2 g of oligo(dT) cellulose (Boehringer Mannheim, Germany) was preswollen in 10 ml of 1 x column loading buffer (20 mM Tris-Cl, pH 7.6, 0.5 M NaCl, 1 mM EDTA, 0.1 % SDS), loaded onto a DEPC-treated, plugged plastic column (Poly Prep Chromatography Column, Bio Rad), and equilibrated with 20 ml 1 x loading buffer. The total RNA (1-2 mg) was heated at 65 °C for 8 min., quenched on ice for 5 min, and after addition of 1 vol 2 x column loading buffer to the RNA sample loaded onto the column. The eluate was collected and reloaded 2-3 times by heating the sample as above and quenching on ice prior to each loading. The oligo(dT) column was washed with 10 vols of 1 x loading buffer, then with 3 vols of medium salt buffer (20 mM Tris-Cl, pH 7.6, 0.1 M NaCl, 1 mM EDTA, 0.1 % SDS), followed by elution of the poly(A)+ RNA with 3 vols of elution buffer (10 mM Tris-Cl, pH 7.6, 1 mM EDTA, 0.05% SDS)

preheated to + 65 °C, by collecting 500 µl fractions. The OD260 was read for each collected fraction, and the mRNA containing fractions were pooled and ethanol precipitated at -20°C for 12 h. The poly(A)+ RNA was collected by centrifugation, resuspended in DEPC-DIW and stored in 5-10 µg aliquots at -80 °C.

cDNA synthesis

First strand synthesis

Double-stranded cDNA was synthesized from 5 µg of poly(A)+ RNA by the RNase H method (Gubler et al. (1983) Gene 25, 263-269; Sambrook et al. (1989), Molecular Cloning: A Laboratory Manual, 2 Ed., Cold Spring Harbor Laboratory, Cold Spring Harbor, New York) using the hair-pin modification. The poly(A)+RNA (5 µg in 5 µl of DEPC-treated water) was heated at 70°C for 8 min. in a pre-siliconized, RNase-free Eppendorph tube, quenched on ice, and combined in a final volume of 50 µl with reverse transcriptase buffer (50 mM Tris-Cl, pH 8.3, 75 mM KCl, 3 mM MgCl₂, 10 mM DTT, Bethesda Research Laboratories) containing 1 mM of dATP, dGTP and dTTP, and 0.5 mM of 5-methyl-dCTP (Pharmacia), 40 units of human placental ribonuclease inhibitor (RNasin, Promega), 1.45 µg of oligo(dT)₁₈- Not I primer (Pharmacia) and 1000 units of SuperScript II RNase H- reverse transcriptase (Bethesda Research Laboratories). First-strand cDNA was synthesized by incubating the reaction mixture at 45 °C for 1 h. After synthesis, the mRNA:cDNA hybrid mixture was gel filtrated through a MicroSpin S-400 HR (Pharmacia) spin column according to the manufacturer's instructions.

Second strand synthesis

After the gel filtration, the hybrids were diluted in 250 µl of second strand buffer (20 mM Tris-Cl, pH 7.4, 90 mM KCl, 4.6 mM MgCl₂, 10 mM (NH₄)₂SO₄, 0.16 mM BNAD+) containing 200 µM of each dNTP, 60 units of *E. coli* DNA polymerase I (Pharmacia), 5.25 units of RNase H (Promega) and 15 units of *E. coli* DNA ligase (Boehringer Mannheim). Second strand cDNA synthesis was performed by incubating the reaction tube at 16°C for 2 h, and an additional 15 min at 25°C. The reaction was stopped by addition of EDTA to 20 mM final concentration followed by phenol

and chloroform extractions.

Mung bean nuclease treatment

The double-stranded (ds) cDNA was ethanol precipitated at -20°C for 12 hours by addition of 2 vols of 96% EtOH, 0.2 vol 10 M NH₄Ac, recovered by centrifugation, washed in 70% EtOH, dried (SpeedVac), and resuspended in 30 µl of Mung bean nuclease buffer (30 mM NaAc, pH 4.6, 300 mM NaCl, 1 mM ZnSO₄, 0.35 mM DTT, 2 % glycerol) containing 25 units of Mung bean nuclease (Pharmacia). The single-stranded hair-pin DNA was clipped by incubating the reaction at 30°C for 30 min, followed by addition of 70 µl 10 mM Tris-Cl, pH 7.5, 1 mM EDTA, phenol extraction, and ethanol precipitation with 2 vols of 96% EtOH and 0.1 vol 3M NaAc, pH 5.2 on ice for 30 min.

15 Blunt-ending with T4 DNA polymerase

The ds cDNAs were recovered by centrifugation (20 000 rpm, 30 min.), and blunt-ended with T4 DNA polymerase in 30 µl of T4 DNA polymerase buffer (20 mM Tris-acetate, pH 7.9, 10 mM MgAc, 50 mM KAc, 1 mM DTT) containing 0.5 mM each dNTP and 5 units of T4 DNA polymerase (New England Biolabs) by incubating the reaction mixture at +16°C for 1 hour. The reaction was stopped by addition of EDTA to 20 mM final concentration, followed by phenol and chloroform extractions and ethanol precipitation for 12 h at -20°C by adding 2 vols of 96% EtOH and 0.1 vol of 3M NaAc, pH 5.2.

Adaptor ligation, Not I digestion and size selection

After the fill-in reaction the cDNAs were recovered by centrifugation as above, washed in 70% EtOH, and the DNA pellet was dried in SpeedVac. The cDNA pellet was resuspended in 25 µl of ligation buffer (30 mM Tris-Cl, pH 7.8, 10 mM MgCl₂, 10 mM DTT, 0.5 mM ATP) containing 2.5 µg non-palindromic BstXI adaptors (1 µg/µl, Invitrogen) and 30 units of T4 ligase (Promega) by incubating the reaction mix at +16°C for 12 h. The reaction was stopped by heating at + 65°C for 20 min, and then on ice for 5 min. The adapted cDNA was digested with Not I restriction enzyme by addition of 20 µl autoclaved water, 5 µl of 10 x Not I restriction enzyme buffer (New England Biolabs) and 50 units

of Not I (New England Biolabs), followed by incubation for 2.5 hours at +37°C. The reaction was stopped by heating the sample at +65°C for 10 min. The cDNAs were size-fractionated by agarose gel electrophoresis on a 0.8% SeaPlaque GTG low melting temperature agarose gel (FMC) in 1 x TBE (in autoclaved water) to separate unligated adaptors and small cDNAs. The gel was run for 12 hours at 15 V, the cDNA was size-selected with a cut-off at 0.7 kb by cutting out the lower part of the agarose gel, and the cDNA was concentrated by running the gel backwards until it appeared as a compressed band on the gel. The cDNA (in agarose) was cut out from the gel, and the agarose was melted at 65°C in a 2 ml Biopure Eppendorph tube (Eppendorph). The sample was treated with agarase by adding 0.1 vol of 10 x agarase buffer (New England Biolabs) and 2 units per 100 µl molten agarose to the sample, followed by incubation at 45°C for 1.5 h. The cDNA sample was phenol and chloroform extracted, and precipitated by addition of 2 vols of 96 % EtOH and 0.1 vol of 3M NaAc, pH 5.2 at - 20°C for 12 h.

20 EXAMPLES

Example 1

Providing novel DNA sequences encoding polypeptide with xylanase activity

Novel sequences with xylanase activity were provided according to the method of the invention using the glycosyl hydrolase family 11 xylanase derived from *Bacillus* sp. (SEQ ID No 1) as the known structural gene sequence.

Identification of conserved regions by alignment

30 An amino acid sequence alignment of ten family 11 xylanases revealed at least 3 conserved sequences. Two of these conserved sequences are used to design appropriate PCR primers for amplification of unknown DNA sequences.

The first conserved sequence shown in SEQ ID No. 3 i.e. 35 "DGGTYDIY" corresponding to position 433-456 in SEQ ID NO 1.

The second conserved sequence shown in SEQ 4, i.e. "EGYQSSG" corresponding to position 631-651 in SEQ ID NO 1.

PCR amplification of the known and unknown partial structural gene sequences

Initially the N-terminal end (i.e. Part A) and the C-terminal (i.e. Part C) of the known xylanase gene, in which the 5 unknown sequence (i.e. Part B) is to be inserted, were amplified by PCR (see figure 4)

Part A was PCR amplified using the two primers (i.e. primer e and primer arc) and as DNA template a plasmid carrying the known xylanase gene (i.e. SEQ ID NO 1).

10 Primer e (shown in SEQ ID NO 5 and figure 1) is an exact N-terminal primer extended with a sequence which included an EcoRI restriction recognition site.

Primer arc (shown in SEQ ID NO 6 and figure 1) is a reverse and complement sequence primer of position 411-432 in SEQ ID NO 15 1.

Part C was PCR amplified using the two primers (i.e. primer f and primer drc) mentioned below and as DNA template a plasmid carrying the known xylanase gene.

Primer f is an exact reverse and complement C-terminal primer 20 mer extended with a sequence which having a SalI restriction recognition site is shown in SEQ ID No. 7.

Primer drc (SEQ ID NO 8) was designed on the basis of position 651-672 in SEQ ID No. 1.

Part B was PCR amplified using two primers (i.e. primer ab 25 and primer cd) and as DNA template DNA purified from a soil sample using the FastDNA® SPIN Kit.

Primer ab (SEQ ID NO 9) has the exact sequence of position 411-432 in SEQ ID 1 extended with degenerated xylanase consensus sequence covering position 433-452 in SEQ ID NO 1

30 Primer cd (SEQ ID NO: 10) has the exact reverse and complement sequence of position 672-651 in SEQ ID NO 1 extended with degenerated xylanase consensus sequence covering position 650-631 in SEQ ID NO 1.

The N-terminal part of the known xylanase gene (Part A) was 35 PCR amplified for 9 min. at 94°C followed by 30 cycles (45 second at 94°C, 45 seconds at 50°C and 1 min. at 72°C) and finally for 7 min. at 72°C. This gave a PCR product of approx. 450 bp.

The C-terminal part (Part C) of the known xylanase gene was PCR amplified for 9 min. at 94°C followed by 30 cycles (45 seconds at 94°C, 45 seconds at 50°C and 1 min. at 72°C) and finally for 7 min. at 72°C. This gave a PCR product of approx. 100 bp.

The unknown sequences (Part B) was PCR amplified for 9 min. at 94°C followed by 40 cycles (45 seconds at 94°C, 45 seconds at 50°C and 1 min. at 72°C) and finally for 7 min. at 72°C. This gave a PCR product of approx. 260 bp.

10 The PCR products mentioned above were carefully purified to avoid remains of template DNA which can produce false positive bands in the following SOE-PCR where the products are joined together to form hybrid sequences.

15 Construction of hybrid sequences

Hybrid sequences containing the N- and C-terminal parts of the known xylanase gene with core part of unknown genes was constructed by splicing by overlap extension PCR (SOE-PCR).

Equal molar amounts of Part A, Part B and Part C PCR products were mixed and PCR amplified under standard conditions except that the reaction was started without any primers.

The reaction started with 9 min. at 94°C followed by 4 cycles (45 seconds at 94°C, 45 seconds at 50°C, 1 min. at 72°C), then primers e and f (SEQ ID No. 5 and 7, respectively) were added, followed by 25 cycles (45 seconds at 94°C, 45 seconds at 50°C, 1 min. at 72°C) and finally 7 min. at 72°C. This gave a SOE-PCR product of the expected size of approx. 770 bp.

30 Cloning of the hybrids

The SOE-PCR product was purified using the QIAquick PCR Purification Kit Protocol and digested overnight with EcoRI and SalI according to the manufacturers recommendation. The digested product was then ligated into an E. coli expression vector overnight at 16°C (in this case a vector where the hybrid gene is under control of a temperature sensitive lambda repressor promoter).

The ligation mixture was transformed into electromax DH10B *E. coli* cells (GIBCO BRL) and plated on LB-ampicillin plates containing 0.1% AZCL Birch xylan. After induction of the promoter (by increasing the temperature to 42°C) xylanase positive colonies were identified as colonies surrounded by a blue halo.

Plasmid DNA was isolated from positive *E. coli* colonies using standard procedures and sequenced with the Taq deoxy terminal cycle sequencing kit (Perkin Elmer, USA) using an Applied Biosystems 373A automated sequencer according to the manufacturer's instructions.

The sequence of a positive clone is shown in SEQ ID NO 11 and the corresponding protein sequence is shown in SEQ ID NO 12.

An alignment of the known xylanase sequence (SEQ ID NO 2) and the novel DNA sequence provided according to the method of the invention can be seen in Figure 3. As can be seen the two protein sequences differs between the two identified conserved regions (i.e. SEQ ID NO 3 and SEQ ID NO 4, respectively).

20 Example 2

Efficiency of the method of the invention

Degenerated primers were designed on the basis of conserved regions identified by alignment of a number of family 5 cellulases and family 10 and 11 xylanases found on the Internet in ExpASY under Prosite (Dictionary of protein sites and patterns).

PCR amplification of a number of unknown structural gene sequences from soil and cow rumen samples were performed with various degenerated primers covering identified conserved region sequences to show how effective the method of the invention is.

The PCR products were cloned into the vector pCRtmII, provided with the original TA cloning kit from Invitrogen. Said vector provides the possibility to make blue-white screening, the white colonies were selected and the inserts were sequenced.

When editing the Sequence Listing below all sequences outside the two EcoRI sites in the polylinker were removed.

Therefore all sequences have a small additional part of the polylinker (i.e. from the EcoRI site to the TT overhang) in both ends of the sequences. These extensions are "GAATTCGGCT" and "AAGCCG".

- 5 1. PCR primers were designed on the basis of identified conserved regions #1 GWNLGN and #2 (E/D)HLIFE of cellulases from the glycosyl hydrolase family 5 aiming to provide novel sequences with cellulase activity.

SEQ ID NO 13 and 14 show the sequences obtained from a soil
10 sample. SEQ ID NO 15 and 16 show the sequences obtained from a cow rumen sample.

2. PCR primers were designed on the basis of identified conserved regions #1 GWNLGN and #3 RA(S/T)GGNN of cellulases from the glycosyl hydrolase family 5 aiming to provide novel
15 sequences with cellulase activity.

SEQ ID NO 17 to 19 show the sequences obtained from a cow rumen sample.

3. PCR primers were designed on the basis of identified conserved regions #2 (E/D)HLIFE and #3 RA(S/T)GGNN of cellula-
20 ses from the glycosyl hydrolase family 5 aiming to provide novel sequences with cellulase activity.

SEQ ID NO 20 to 22 show the sequences obtained from a cow rumen sample.

4. PCR primers were designed on the basis of identified
25 conserved regions #4 HTLVWH and #5 WDVVNE of xylanases from the glycosyl hydrolase family 10 aiming to provide novel sequences with xylanase activity.

SEQ ID NO 23 to 28 show the sequences obtained from a cow rumen sample.

- 30 5. PCR primers were designed on the basis of the identified conserved regions #4 HTLVWH and #6 (F/Y)(I/Y)NDYN of xylanases from the glycosyl hydrolase family 10 aiming to provide novel sequences with xylanase activity.

SEQ ID NO 29 to 33 show the sequences obtained from a cow rumen
35 sample.

6. PCR primers were designed on the basis of the identified conserved regions #5 WDVVNE and #6 (F/Y)(I/Y)NDYN of xylanases from the glycosyl hydrolase family 10 aiming to provide novel

sequences with xylanase activity.

SEQ ID NO 34 to 36 show the sequences obtained from a soil sample. SEQ ID NO 37 to 45 show the sequences obtained from a cow rumen sample

5 7. PCR primers were designed on the basis of the identified conserved regions #8 DGGTYDIY and #9 EGYQSSG of xylanases from the glycosyl hydrolase family 11 aiming to provide novel sequences with xylanase activity.

10 SEQ ID NO 46 to 49 show the sequences obtained from a soil sample. SEQ ID NO 50 to 54 show the sequences obtained from a cow rumen sample.

60 clones with inserts were sequenced and resulted in 43 different sequences all encoding either a part of a cellulase or a part of a xylanase. Only 2 of the 43 sequences were 15 similar to sequence found in the sequence databases Genbank.

SEQ ID NO 49 was found to be similar to Xylanase A from *Bacillus pumilus*. SEQ ID NO 42 was found to be similar to a xylanase from *Prevotella ruminicola*.

20 **Example 3**

Construction of novel hybrid DNA sequences encoding polypeptides with endoglucanase activity

Novel hybrid DNA sequences with endoglucanase activity were provided by first identifying two conserved regions common for 25 the following family 45 cellulases (see WO 96/29397): *Humicola insolens* EGV (disclosed in WO 91/17243), *Fusarium oxysporum* EGV (Sheppard et al., Gene (1994), Vol. 15, pp.163-167), *Thielavia terrestris*, *Myceliophthora thermophila*, and *Acremonium* sp (disclosed in WO 96/29397).

30 The amino acid sequence alignment revealed two conserved region.

The first conserved region "Thr Arg Tyr Trp Asp Cys Cys Lys Pro/Thr" shown in SEQ ID NO 57 corresponds to position 6 to 14 of SEQ ID NO 55 showing the *Humicola insolens* EG V 43 KDa 35 endoglucanase.

The second conserved region "Trp Arg Phe/Tyr Asp Trp Phe" shown in SEQ ID NO 58 corresponding to positions 169 to 198 of SEQ ID NO 55 showing the *Humicola insolens* EGV 43 KDa

endoglucanase.

Two degenerate, deoxyinosine-containing oligonucleotide primers (sense; primer s and antisense; primer as) were constructed) for PCR amplification of unknown gene sequences. The 5 deoxyinosines are depicted by an I in the primer sequences.

Primers s and primer as are shown in SEQ ID No. 59 and 60 respectively.

The *Humicola insolens* EG V structural gene sequence (SEQ ID NO 55) was used as the known DNA sequence. A number of fungal DNA sequences mentioned below were used as the unknown sequences.

PCR cloning of the family 45 cellulase core region and the linker/CBD of *Humicola insolens* EG V.

15 Approximately 10 to 20 ng of double-stranded, cellulase-induced cDNA from *Humicola nigrescens*, *Cylindrocarpon* sp., *Fusarium anguioides*, *Gliocladium catenulatum*, and *Trichothecium roseum* prepared, as described above in the Material and Methods section were, PCR amplified in Expand buffer (Boehringer Mannheim, Germany) containing 200 μ M each dNTP and 200 pmol of each degenerate Primer s (SEQ ID NO 59) and Primer as (SEQ ID NO 60) a DNA thermal cycler (Perkin-Elmer, Cetus, USA) and 2.6 units of Expand High Fidelity polymerase (Boehringer Mannheim, Germany). 30 cycles of PCR were performed using a cycle profile of 25 denaturation at 94°C for 1 min, annealing at 55°C for 2 min, and extension at 72°C for 3 min, followed by extension at 72°C for 5 min.

The PCR fragment coding for the linker/CBD of *H. insolens* EGV was generated in Expand buffer (Boehringer Mannheim, Germany) containing 200 μ M each dNTP using 100 ng of the pCaHj418 template, 200 pmol forward primer 1 (SEQ ID NO 61), 200 pmol reverse primer 1 (SEQ ID NO 62). 30 cycles of PCR were performed as above.

35 Construction of hybrid genes using splicing by overlap extension (SOE)

The PCR products were electrophoresed in 0.7 % agarose gels (SeaKem, FMC), the fragments of interest were excised from the

gel and recovered by Qiagen gel extraction kit (Qiagen, USA) according to the manufacturer's instructions. The recombinant hybrid genes were generated by combining the overlapping PCR fragments from above (ca. 50 ng of each template) in Expand 5 buffer (Boehringer Mannheim, Germany) containing 200 μ M each dNTP in the SOE reaction. Two cycles of PCR were performed using a cycle profile of denaturation at 94°C for 1 min, annealing at 50 C for 2 min, and extension at 72°C for 3 min, the reaction was stopped, 250 pmol of each end-primer: forward 10 primer 2 (SEQ ID NO 63) encoding the TAKA-amylase signal sequence from *A. oryzae*, reverse primer 2 (SEQ ID NO 64) was added to the reaction mixture, and an additional 30 cycles of PCR were performed using a cycle profile of denaturation at 94°C for 1 min, annealing at 55 °C for 2 min, and extension at 72°C 15 for 3 min.

Construction of the expression cassettes and heterologous expression in *Aspergillus oryzae*

The PCR-generated, recombinant fragments were electropho- 20 resed in 0.7 % agarose gels (SeaKem, FMC), the fragments were excised from the gel and recovered by Qiagen gel extraction kit (Qiagen, USA) according to the manufacturer's instructions. The DNA fragments were digested to completion with BamHI and XbaI, and ligated into BamHI/XbaI-cleaved pHD414 vector. Co-transfor- 25 mation of *A. oryzae* was carried out as described in Christensen et al. (1988), Bio/Technology 6, 1419-1422. The AmdS+ transformants were screened for cellulase activity using 0.1 % AZCl-HE-cellulose in a plate assay as described above. The cellulase-producing transformants were purified twice through conidial 30 spores, cultivated in 250 ml shake flasks, and the amount of secreted cellulase was estimated by SDS-PAGE, Western blot analysis and the activity assay as described earlier (Kauppinen et al. (1995), J. Biol. Chem. 270, 27172-27178;; Kofod et al. (1994), J. Biol. Chem. 269, 29182-29189; Christgau et. 35 al,(1994), Biochem. Mol. Biol. Int. 33, 917 - 925).

Nucleotide sequence analysis

The nucleotide sequences of the novel hybrid gene fusions were determined from both strands by the dideoxy chain-termination method (Sanger et al., (1977), Proc. Natl. Acad. Sci. U.S.A. 74, 5463-5467), using 500 ng template, the Taq 5 deoxy-terminal cycle sequencing kit (Perkin-Elmer, USA), fluorescent labeled terminators and 5 pmol of synthetic oligonucleotide primers. Analysis of the sequence data was performed according to Devereux et al., 1984 (Devereux et al., (1984), Nucleic Acids Res. 12, 387-395).

10 The provided novel hybrid DNS sequences and the deduced protein sequences are shown in SEQ ID NO 65 to 74.

SEQ ID NO 65 shows the hybrid gene construct comprising the family 45 cellulase core region from *Humicola nigrescens* and the linker/CBD of *Humicola insolens* EG V. SEQ ID NO 66 shows 15 the deduced amino acid sequence of the hybrid gene construct.

SEQ ID NO 67 shows the hybrid gene construct comprising the family 45 cellulase core region from *Cylindrocarpus* sp. and the linker/CBD of *Humicola insolens* EG V. SEQ ID NO 68 shows the deduced amino acid sequence of the hybrid gene construct.

20 SEQ ID NO 69 shows the hybrid gene construct comprising the family 45 cellulase core region from *Fusarium anguioide* and the linker/CBD of *Humicola insolens* EG V. SEQ ID NO 70 shows the deduced amino acid sequence of the hybrid gene construct.

SEQ ID NO 71 shows the hybrid gene construct comprising the 25 family 45 cellulase core region from *Gliocladium catenulatum* and the linker/CBD of *Humicola insolens* EG V. SEQ ID NO 72 shows the deduced amino acid sequence of the hybrid gene construct.

SEQ ID NO 73 shows the novel gene construct comprising the 30 family 45 cellulase core region from *Trichothecium roseum* and the linker/CBD of *Humicola insolens* EG V. SEQ ID NO 74 shows the deduced amino acid sequence of the hybrid gene construct.

SEQUENCE LISTING

(1) GENERAL INFORMATION:

(i) APPLICANT:

- 5 (A) NAME: Novo Nordisk A/S
 (B) STREET: Novo Alle
 (C) CITY: Bagsvaerd
 (E) COUNTRY: Denmark
 (F) POSTAL CODE (ZIP): DK-2880
 10 (G) TELEPHONE: +45 4444 8888
 (H) TELEFAX: +45 4449 3256
 (ii) TITLE OF INVENTION: Method for providing novel DNA sequences
 (iii) NUMBER OF SEQUENCES: 74
 (iv) COMPUTER READABLE FORM:
 15 (A) MEDIUM TYPE: Floppy disk
 (B) COMPUTER: IBM PC compatible
 (C) OPERATING SYSTEM: PC-DOS/MS-DOS
 (D) SOFTWARE: PatentIn Release #1.0, Version #1.30 (EPO)

PATENT CLAIMS

1. A method for providing a novel DNA sequence encoding a polypeptide from a micro-organism with an activity of interest
5 comprises the following steps:
i) PCR amplification of said DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest,
ii) linking the obtained PCR product to a 5' structural gene
10 sequence and a 3' structural gene sequence,
iii) expressing said resulting hybrid DNA sequence,
iv) screening for hybrid DNA sequences encoding a polypeptide with said activity of interest or related activity,
v) isolating the hybrid DNA sequence identified in step iv)
15
2. The method according to claim 1 wherein the PCR primers in step i) have homology to conserved regions in (a) known structural gene(s) or the polypeptide(s) thereof.
- 20 3. The method according to claim 1 wherein the PCR primers in step i) are degenerated on the basis of conserved regions in (a) known gene(s).
4. The method according to any of claims 1 to 3 wherein the PCR
25 amplification in step i) is performed using naturally occurring DNA as template.
5. The method according to any of claims 1 to 3 wherein the microorganism has not been subjected to "in vitro" selection.
30
6. The method according to any of claims 1 to 5 wherein the PCR amplification in step i) is performed on a sample containing DNA from an un-isolated microorganism.
- 35 7. The method according to any of claims 1 to 6 wherein the 5' and 3' structural gene sequences originate from two different structural genes encoding polypeptides having the same activity.

8. The method according to any of claims 1 to 7 wherein the 5' structural gene sequence and the 3' structural gene sequence originate from the same structural gene sequence.

9. The method according to any of claims 1 to 8 wherein the 5' structural gene sequence and the 3' structural gene sequence originate from two different structural gene sequences encoding polypeptides having different activities.

10. The method according to any of claims 1 to 9 comprising the following steps:

- i) PCR amplification of DNA from micro-organisms with PCR primers being homologous to conserved regions of a known gene encoding a polypeptide with an activity of interest,
- ii) cloning the obtained PCR product into a gene encoding a polypeptide having the activity of interest, where said gene is not identical to the gene from which the PCR product is obtained, which gene is situated in an expression vector,
- iii) transforming said expression vector into a suitable host cell,
- iiia) culturing said host cell under suitable conditions,
- iv) screening for clones comprising a DNA sequence originated from the PCR amplification in step i) encoding a polypeptide with said activity of interest or related activity,
- v) isolating the DNA sequence identified in step iv).

11. The method according to claims 1 to 10, wherein the micro-organism from which DNA is to be PCR amplified in step i) is a prokaryote or an eukaryote.

12. The method according to any of claims 1 to 11, wherein the PCR amplification in step i) is performed on DNA from an uncultivable organism.

13. The method according to claim 12, wherein the un-cultivable organism is an algae, a fungi or a protozoa.

5 14. The method according to claims 12 and 13, wherein said un-cultivable organism is from the group of extremophiles and planktonic marine organisms.

15. The method according to any of claims 1 to 11, wherein the
10 PCR amplification in step i) is performed on DNA from a cultivable organism.

16. The method according to claim 15, wherein said cultivable
organism is selected from the group of bacteria, fungal
15 organisms, such as filamentous fungi or yeasts.

17. The method according to claim 16, wherein said PCR amplification in step i) is performed on one or more polynucleotides comprised in a vector, plasmid or the like, such as on a cDNA
20 library from cultivable organisms.

18. The method according any of claims 1 to 17, wherein said activity of interest is an enzymatic activity.

25 19. The method according to claim 18, wherein said enzyme activity is selected from the group comprising phosphatases oxidoreductases, transferases, hydrolases, such as esterases, in particular lipases and phytases, such as glucosidases, in particular xylanases, cellulases, hemicellulases, and amylases,
30 such as peptidases, in particular proteases, lyases, isomerases and ligases.

20. The method according to any of claims 10 to 19, wherein said host cell mentioned under iii) of claim 10 is a micro-organism,
35 preferably a yeast or a bacteria.

21. The method according to claim 20, wherein said host cell is a yeast such as a strain of *Saccharomyces*, in particular

Saccharomyces cerevisiae.

22. The method according to claim 20, wherein said host cell is a bacteria such as a strain of *Bacillus*, in particular of
5 *Bacillus subtilis*, or a strain *Escherichia coli*.

23. The method according to any of claims 1 to 22, wherein the clones/hybrid DNA sequences mentioned in step iv), are screened for enzymatic activity.

10

24. The method according to claim 23, wherein the screened clones/hybrid DNA sequences are tested for wash performance.

25. A novel DNA sequence provided according to any of the method
15 claims 1 to 24.

26. A polypeptide with an activity of interest encoded by a DNA sequence of claim 25.

(54) Title: METHOD OF PROVIDING NOVEL DNA SEQUENCES

(57) Abstract

The present invention relates to a method of providing novel DNA sequences encoding a polypeptide with an activity of interest, comprising the following steps: i) PCR amplification of said DNA with PCR primers with homology to (a) known gene(s) encoding a polypeptide with an activity of interest, ii) linking the obtained PCR product to a 5' structural gene sequence and a 3' structural gene sequence, iii) expressing said resulting hybrid DNA sequence, iv) screening for hybrid DNA sequences encoding a polypeptide with said activity of interest or related activity, v) isolating the hybrid DNA sequence identified in step iv). Further, the invention also relates novel DNA sequences provided according to the method of the invention and polypeptides with an activity of interest encoded by said novel DNA sequences of the invention.

INTERNATIONAL SEARCH REPORT

International Application No.

PCT/DK 97/00216

A. CLASSIFICATION OF SUBJECT MATTER

IPC 6 C12N15/10 C12N15/62 C12N15/56 C12N9/24 C12N9/42
C12Q1/68

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6 C12N C12Q

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 368 684 A (MEDICAL RES COUNCIL) 16 May 1990 see the whole document	1, 2, 4, 8, 10, 11, 20, 25, 26
X	SARANTOPOULOS S ET AL: "A METHOD FOR LINKING VL AND VH REGIONS GENES THAT ALLOWS BULK TRANSFER BETWEEN VECTORS FOR USE IN GENERATING POLYCLONAL IgG LIBRARIES" JOURNAL OF IMMUNOLOGY, vol. 152, no. 11, 1 June 1994, pages 5344-5351, XP002031702 see the whole document	1, 2, 4, 8, 10, 11, 20, 25, 26

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Date of the actual completion of the international search
